Interface Specification

INNER TRIPLET CORRECTOR MQSXA

Abstract

MQSXA corrector packages are mated with MQXA quadrupoles in the LMQXC assemblies. This specification codifies the envelope and attachments that constrain the MQSXA deliverable such that the attachment can be completed.

1. INTRODUCTION

Each inner triplet of LHC [1] is assembled from a set of components, including the main quadrupole elements MQXA and MQXB, and corrector elements MCBX, MCBXA, and MQSXA (figure 1). The MCBX, MCBXA and MQSXA corrector packages are incorporated into the LMQX helium vessels, and operate in a 1.9K helium bath which surrounds the corrector and is contained by a separate cylinder.

The MQSXA assembly [2] includes the skew quadrupole corrector winding, in series with 3 higher order correctors.

The correctors are procured by CERN, and delivered fully tested to Fermilab for final assembly with the main quadrupoles.

2. MQSXA INTERFACES

2.1 MECHANICAL

The MQSXA corrector package has a mechanical envelope and mass as defined in [3]. The quadrupole package is located at the flange end of the assembly; the OD of the flange will be 250mm; 4 15mm through holes at ± 45 degrees from vertical and at a diameter of 215mm will be provided in the flange. This envelope is consistent with the volume provided in the LMQX assembly, and the flange shown on the non-lead end of the corrector outer cylinder mates with the attachment element used to connect the corrector to the LMQXC assembly.

A minimum 70mm bore provides adequate clearance for insertion of a beam tube during final assembly.

2.2 ELECTRICAL

The MQSXA is provided to Fermilab with two 600A leads extending from the non-flange end of the package, and six 120 A leads from the flange end of the package. CERN will provide the leads out to the current lead mounting plate attached to each unit. The leads are labeled A and B in accordance with CERN specification [4].

Each layer of the MQSXA come with a single voltage tap attached to the "A" lead, for diagnostic purposes. The corrector unit will be delivered with 10m of 26 gauge wire for each of these taps [5].

There are no temperature sensors or quench heaters associated with these units.

2.3 ALIGNMENT

Alignment information for the dipole layers is transmitted in rotation by a scribe line that will be located on the exterior surface of the cylinder to serve as a rotational alignment mark. For position of the axis, the outer cylinder of the corrector element is concentric with the beam axis.
